

Quick Reference Guide

Hetzner VPS · AlgoTrading Bot · Daily Operations

[■ Hetzner VPS](#)[■ Docker](#)[■ Freqtrade Bot](#)[■ SSH Access](#)

YOUR SERVER DETAILS

IP Address	46.225.238.202
Location	Nuremberg, Germany (Hetzner)
User	root
Project path	/root/AlgoTrading
Bot UI port	8080 (via SSH tunnel)
Provider	hetzner.com → Cloud Console

Version 1.0 · June 2026

1 Connecting to the Server

Basic SSH connection

Open Terminal on your Mac and run:

```
ssh root@46.225.238.202
```

Enter your Hetzner password when prompted. You'll see:

```
root@ubuntu-4gb-nbg1-1:~#
```

That prompt means you're inside the server. You can now run any command.

Access the Web UI (FreqUI)

The bot's web interface runs on port 8080 of the server but is not exposed to the internet. You access it securely via an SSH tunnel:

```
ssh -L 8080:localhost:8080 root@46.225.238.202
```

Keep this terminal open, then go to **http://localhost:8080** in your browser.

Login	Value
URL	http://localhost:8080
Username	freqtrade
Password	change-this-password

- Closing the SSH tunnel terminal only closes your UI access — the bot keeps running on the server. You do NOT need to stay connected for the bot to trade.

2 Bot Commands — Start, Stop, Monitor

All bot commands must be run from inside the project folder on the server. After connecting via SSH:

```
cd /root/AlgoTrading
```

Essential commands

Command	What it does
<code>docker compose up -d</code>	Start the bot (background mode)
<code>docker compose down</code>	Stop the bot completely
<code>docker compose restart</code>	Restart the bot (after config changes)
<code>docker compose ps</code>	Check if the bot container is running
<code>docker logs freqtrade -f</code>	Watch live logs (Ctrl+C to stop watching)
<code>docker logs freqtrade --tail 50</code>	Show last 50 log lines

What the logs look like when healthy

```
INFO - Starting worker 2026.5.1
INFO - Using config: /freqtrade/user_data/config.json
INFO - Changing state to: RUNNING
INFO - Dry run is enabled. All trades are simulated.
INFO - Exchange: binance | Strategy: RSIStrategy
```

Log levels — what to look for

Level	Meaning	Action needed
INFO	Normal operation	None — all good
WARNING	Unexpected but not critical	Read it, usually harmless
ERROR	Something failed	Investigate — check config
CRITICAL	Fatal — bot will stop	Fix immediately

3 Updating the Strategy or Config

When you change the strategy or config on your Mac and push to GitHub, you need to pull the changes to the server and restart the bot.

Workflow: Mac → GitHub → Server

Step	Where	Command
1. Edit files	Your Mac	Edit RSIStrategy.py or config.json
2. Push to GitHub	Your Mac	git add . && git commit -m '...' && git push
3. SSH into server	Terminal	ssh root@46.225.238.202
4. Go to project	Server	cd /root/AlgoTrading
5. Pull latest code	Server	git pull
6. Restart bot	Server	docker compose restart
7. Check logs	Server	docker logs freqtrade --tail 20

Quick update — all in one block

Once you're on the server, this does steps 4–7 in one go:

```
cd /root/AlgoTrading && git pull && docker compose restart && docker logs freqtrade --tail 20
```

- Always restart the bot after any change to config.json or RSIStrategy.py. The bot reads these files only at startup — changes won't take effect otherwise.

4 Server Health & Maintenance

Useful commands to check how the server is doing. Run these after connecting via SSH:

System health

Command	What it does
<code>uptime</code>	How long the server has been running
<code>free -h</code>	RAM usage (should have >1GB free)
<code>df -h</code>	Disk usage (should be <70% used)
<code>top</code>	Live CPU and memory usage (q to quit)
<code>docker stats</code>	CPU/RAM used by the bot container

Server maintenance

Command	What it does
<code>apt update && apt upgrade -y</code>	Update all server software (do monthly)
<code>reboot</code>	Restart the server (bot auto-restarts after)
<code>docker system prune -f</code>	Clean up unused Docker images/containers
<code>du -sh /root/AlgoTrading/user_data/logs/</code>	Check log file size

Bot data files

Command	What it does
<code>ls /root/AlgoTrading/user_data/</code>	List all bot data folders
<code>ls /root/AlgoTrading/user_data/logs/</code>	List log files
<code>tail -f /root/AlgoTrading/user_data/logs/watchdog.log</code>	Watch bot log directly
<code>ls /root/AlgoTrading/user_data/data/</code>	List downloaded market data

- The bot auto-restarts if the server reboots — Docker's **restart: unless-stopped** policy in `docker-compose.yml` handles this automatically.

5

Going Live — Switching to Real Money

When you're ready to trade with real money, these are the exact steps on the server:

Step 1 — Edit config.json on the server

```
nano /root/AlgoTrading/user_data/config.json
```

Find these lines and update them:

```
"key":      "paste-your-binance-api-key-here",  
"secret":   "paste-your-binance-secret-here",  
...  
"dry_run":  false,  
"stake_amount": 20
```

Save and exit nano: press **Ctrl+X** → **Y** → **Enter**.

Step 2 — Restart the bot

```
docker compose restart
```

Step 3 — Confirm it's live

```
docker logs freqtrade --tail 5
```

You should NOT see 'Dry run is enabled' anymore.

■ IMPORTANT SECURITY RULES FOR BINANCE API KEYS

- Enable: Read + Spot Trading only
- **NEVER enable Withdrawals** — if keys leak, nobody can steal your funds
- Restrict to your server IP: 46.225.238.202
- Store keys **ONLY** in config.json on the server — never in GitHub

6

Daily Cheat Sheet

Everything you need for day-to-day management on one page:

Connect	
<code>ssh root@46.225.238.202</code>	Log into the server
<code>ssh -L 8080:localhost:8080 root@46.225.238.202</code>	Open Web UI tunnel
Bot control	
<code>cd /root/AlgoTrading</code>	Go to project folder (always first)
<code>docker compose up -d</code>	Start the bot
<code>docker compose down</code>	Stop the bot
<code>docker compose restart</code>	Restart after changes
<code>docker compose ps</code>	Is the bot running?
Monitor	
<code>docker logs freqtrade -f</code>	Watch live logs
<code>docker logs freqtrade --tail 30</code>	Last 30 log lines
<code>docker stats</code>	CPU/RAM usage
<code>free -h</code>	Server memory
Update	
<code>git pull</code>	Pull latest code from GitHub
<code>git pull && docker compose restart</code>	Pull + restart in one command
Troubleshoot	
<code>docker compose down && docker compose up -d</code>	Full stop and start
<code>apt update && apt upgrade -y</code>	Update server software

Server IP: **46.225.238.202** | Web UI: **http://localhost:8080** | Project: **/root/AlgoTrading**
